DECLARATION

I hereby certify that the work which is being presented in the project report entitled “**Eyra**” in partial fulfilment of requirement for the award of the degree of Bachelor of Engineering (Computer Science and Engineering) submitted in the department of Computer Science and Engineering at Chitkara University Institute of Engineering and Technology, Chitkara University, Punjab, India, is an authentic record of my own work carried out under the supervision of **Shikha Tuteja**. The matter presented in this project report has not been submitted in any other university/institute for the award of any degree.

Place: Rajpura

Date : 28 April 2026

Jashanjit Kaur (2210990440)

Vrinda Verma (2210990969)

Aayush Sharma (2210991138)

Yashasvi Nag (2210990975)

This is to certify that the above statement made by the candidate is correct to the best of my knowledge and belief.

Shikha Tuteja

Associate Professor

Department of Computer Science and Engineering

Chitkara University Institute of Engineering and Technology,

Chitkara University, Punjab, India

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to **Dr. Shikha Tuteja**, for her valuable guidance, continuous support, and encouragement throughout the completion of this project. I also extend my thanks to the **Department of Computer Science and Engineering, Chitkara University**, for providing the academic environment and resources necessary to carry out this work. This project enabled me to gain practical exposure to real-world software development concepts and strengthen my technical skills. I am grateful to my peers for their cooperation and constructive discussions, and I acknowledge the support of everyone who contributed, directly or indirectly, to the successful completion of this project.

1. Abstract/Keywords

Eyra: AI-Powered Mental Health Support Platform is an intelligent and user-centric application designed to make mental health support more accessible, private, and interactive. The platform addresses the growing need for easily accessible mental wellness resources by providing users with a safe digital space to explore their emotional well-being without fear of stigma or judgment. Eyra enables individuals to engage in meaningful conversations, assess their mental health, and gain insights into their emotional patterns, thereby promoting awareness and early intervention.

The platform leverages the MERN stack (MongoDB, Express.js, React.js, Node.js) to deliver a scalable and efficient system architecture. The frontend is designed to be intuitive and responsive, ensuring a seamless user experience, while the backend efficiently manages data processing, authentication, and AI integration. MongoDB Atlas is used for secure and flexible data storage, and tools like Visual Studio Code and GitHub support development and collaboration.

At the core of Eyra lies its AI-powered conversational system, which provides context-aware and empathetic responses to users. The platform also integrates clinically validated mental health, allowing users to evaluate their mental health status accurately. In addition, Eyra offers features like mood tracking and analytics, which present emotional trends through visual representations, helping users understand their mental state over time.

Eyra incorporates multiple features focused on security, personalization, and usability. Secure authentication using JWT ensures safe user access, while encrypted data handling protects sensitive information. The platform supports multiple chat sessions, personalized interactions, and detailed assessment reports, which can be shared via email. An experimental facial expression analysis feature further enhances the system by providing non-verbal emotional insights, complementing traditional text-based inputs.

2. Introduction

2.1 Background

In recent years, mental health has emerged as a critical global concern, affecting individuals across all age groups and socio-economic backgrounds. Despite increased awareness, access to mental health support remains limited due to factors such as high costs, social stigma, lack of professional availability, and geographical barriers. Many individuals hesitate to seek help due to fear of judgment or lack of awareness about their own mental health condition.

At the same time, the rapid advancement of technology, particularly in Artificial Intelligence (AI), has opened new avenues for delivering accessible and scalable healthcare solutions. Digital platforms are increasingly being explored as tools to bridge the gap between individuals and mental health resources. However, most existing solutions either lack personalization, fail to ensure user privacy, or do not incorporate clinically validated methods.

Eyra: AI-Powered Mental Health Support Platform is developed as a response to these challenges. It is designed to provide a safe, private, and user-friendly digital environment where individuals can explore their emotional well-being without fear of stigma or judgment. The platform integrates conversational AI with clinically grounded self-assessment tools to offer meaningful support and insights.

Built using the MERN stack (MongoDB, Express.js, React.js, Node.js), Eyra ensures a scalable and efficient system architecture. It combines modern web technologies with psychological assessment frameworks to create a holistic mental health support system. Features such as AI-powered chat, mood tracking, and real-time analytics enable users to better understand their mental state over time.

Eyra goes beyond being just a technological solution—it represents a shift toward proactive mental health management. By making support accessible anytime and anywhere, the platform empowers users to take the first step toward mental well-being in a comfortable and non-intimidating way.

2.2 Problem Statement

The increasing prevalence of mental health issues such as anxiety, depression, and stress highlights the urgent need for accessible and effective support systems. However, traditional mental healthcare systems face several limitations that prevent individuals from seeking timely help.

Some of the key challenges include:

- **Limited Accessibility:** Professional mental health services are not always easily accessible, especially in rural or underserved areas.
- **High Costs:** Therapy and clinical consultations can be expensive, making them unaffordable for many individuals.
- **Social Stigma:** Fear of being judged often discourages people from seeking help.
- **Lack of Awareness:** Many individuals are unable to identify or understand their mental health conditions.
- **Absence of Continuous Monitoring:** Traditional systems lack tools for regular mood tracking and early detection of issues.

Eyra addresses these challenges by providing a comprehensive and intelligent solution that bridges the gap between users and mental health support. The platform offers:

- **AI-Powered Chat Support:** Enables users to engage in safe, anonymous, and context-aware conversations.
- **Mood Tracking & Analytics:** Visual insights to monitor emotional patterns over time.
- **Privacy-Focused Design:** Secure authentication and data handling mechanisms.
- **Personalized Experience:** Tailored insights based on user interactions and assessments.

By combining technology with psychological principles, Eyra simplifies the process of understanding and managing mental health.

3. Software and Hardware Requirement Specification

3.1 Software Requirements

- **Node.js (version 14.x or higher):** Node.js enables the execution of JavaScript on the server side, supporting asynchronous I/O operations and ensuring the backend is responsive and scalable.
- **MongoDB (version 4.x or higher):** As a NoSQL database, MongoDB stores all data related to products, user profiles, and transactions.
- **Express.js (latest stable version):** The web application framework used in the backend to manage routing, middleware, and API requests.
- **React.js (latest stable version):** React.js is used on the frontend for building dynamic user interfaces.
- **JWT (for secure authentication):** JWT is used to manage user authentication and session management. Ensuring that the latest version of the JWT library is used helps prevent security vulnerabilities and enhances the efficiency of the authentication process.
- **Axios:** Axios is used for handling HTTP requests from the frontend. It simplifies the communication between the client and server, ensuring that data is fetched and displayed in real-time.
- **Git:** As a version control system, Git helps manage and track changes to the codebase. This ensures collaboration is smooth and that all changes are well-documented.
- **Visual Studio Code:** A lightweight, powerful code editor with features like IntelliSense, debugging, Git integration, and support for multiple programming languages, providing a streamlined development environment for both front-end and back-end projects.

3.2 Hardware Requirements

- **Processor:** A processor equivalent to an **Intel Core i5** or higher is recommended for smooth development and testing performance. A fast processor ensures that the development environment runs efficiently and that complex processes like compiling and testing are completed without delays.
- **RAM:** A minimum of **8 GB of RAM** is required for handling the development environment, running multiple applications simultaneously (such as the code editor, browser, and server), and ensuring that the platform performs well during testing.
- **Storage:** At least **100 GB of free storage space** is necessary to store project files, databases, dependencies, and backups.
- **Internet Connection:** A stable internet connection is required to access online resources, download necessary dependencies, test APIs, and deploy the application to cloud services

4. Methodology

The methodology adopted for the development of *Eyra – AI-Powered Mental Health Support Platform* focuses on building a scalable, secure, and user-centric system that integrates artificial intelligence with clinically grounded mental health support mechanisms. A structured approach combining modern software engineering practices, AI integration, secure backend systems, and intuitive frontend design was followed. This ensures reliability, performance, and maintainability while addressing the core objective of accessible mental health support.

4.1 Development Process -

- **Agile Methodology** was adopted to manage the project efficiently. The development process was divided into iterative sprints, each focusing on specific features such as authentication, AI chat integration, mental health assessments, analytics dashboard, and user profile management. Regular testing and feedback cycles ensured early bug detection and continuous improvement.
- **Modular Development** approach was used to divide the system into independent modules such as authentication, chat system, assessment engine, analytics, and user management. Each module was developed and tested independently before integration, improving maintainability, scalability, and team collaboration.

4.2 Backend Development -

- **Node.js** was used as the runtime environment due to its asynchronous, non-blocking architecture, enabling efficient handling of multiple concurrent user requests, especially important for real-time chat functionality.
- **Express.js** was used as the backend framework to build RESTful APIs. It streamlined routing, middleware integration, and request handling for features such as user authentication, chat processing, assessment submission, and analytics retrieval.

- **RESTful API Design** ensured seamless communication between frontend and backend using standard HTTP methods (GET, POST, PUT, DELETE). This approach supports scalability and future integration with external services.
- **AI Integration** enabled context-aware conversational capabilities. The backend processes user inputs and interacts with the AI model to generate empathetic and relevant responses.

4.3 Database Management -

- **MongoDB Atlas** was used as a cloud-based NoSQL database for storing user data, chat history, assessment responses, and analytics.
- **Mongoose ODM** was used to define schemas and manage structured data, ensuring consistency and validation.
- Separate collections were maintained for:
 - Users
 - Chat Sessions
 - History

This structure ensures efficient querying and scalability.

4.4 Authentication and Security -

- **JWT (JSON Web Tokens):**

JWT-based authentication was implemented to provide secure and stateless user session management. Upon successful login, a token is generated and stored securely on the client side. This token is included in subsequent requests to authenticate users and grant access to protected routes such as chat sessions, assessment results, and user profiles. This ensures that only authorized users can access their data.

- **Password Encryption (bcrypt):**

User passwords are securely stored using hashing techniques provided by bcrypt. This prevents unauthorized access to sensitive credentials even in the event of a data breach.

- **Secure Communication (HTTPS):**

All data exchanged between the client and server is encrypted using HTTPS, ensuring protection against interception and man-in-the-middle attacks.

- **Input Validation and Error Handling:**

Server-side validation mechanisms were implemented to prevent malicious inputs, ensuring data integrity and system stability.

- **Privacy-Focused Design:**

The platform follows a data minimization approach, collecting only essential user information. Additionally, clear consent mechanisms and secure storage practices ensure that user privacy is always maintained

4.5 Frontend Development -

The frontend of Eyra was designed to provide a clean, intuitive, and emotionally supportive user experience, ensuring ease of use and accessibility for all users.

- **React.js:**

React.js was used for frontend development due to its component-based architecture and efficient rendering capabilities. This allowed the application to be structured into reusable and maintainable components.

- **Component-Based Design:**

The user interface was divided into modular components such as:

- Chat Interface

- Assessment Forms
- Dashboard and Analytics
- Navigation Bar and Layout Components

This approach improved consistency across the application and reduced code redundancy.

- **Responsive and Accessible Design:**

The platform was designed to be fully responsive, ensuring compatibility across different devices including desktops, tablets, and smartphones. Special attention was given to creating a distraction-free interface, particularly for assessment and chat modules.

4.6 Tools and Collaboration -

Effective collaboration and version control were essential for the successful completion of the project.

- **GitHub** was used for version control, allowing team members to collaborate.
- **Visual Studio Code (VS Code)** was adopted as the primary Integrated Development Environment (IDE).

5. Software Design

5.1 System Architecture

Eyra: AI-Powered Mental Health Support Platform follows a **three-tier architecture**, ensuring clear separation of concerns, scalability, and ease of maintenance. This architectural approach allows independent development, testing, and scaling of different system components.

- **Presentation Layer (Frontend):**

The presentation layer is developed using React.js and is responsible for handling all user interactions. It provides an intuitive interface for features such as AI-based chat, mental health assessments, user dashboards, and analytics visualization. The layer ensures a responsive and user-friendly experience across devices while maintaining a clean and distraction-free design suitable for mental health applications.

- **Application Layer (Backend):**

Implemented using Node.js and Express.js, this layer manages the core business logic of the platform. It handles API requests, user authentication, chat processing, assessment evaluation, and communication with AI services. RESTful APIs are used to ensure smooth interaction between the frontend and backend. This layer acts as the bridge between the user interface and the database.

- **Data Layer (Database):**

MongoDB Atlas is used as the data layer to securely store and manage application data. This includes user profiles, chat histories, assessment responses, and analytics data. The NoSQL structure allows flexibility in handling dynamic and unstructured data, ensuring scalability and efficient data retrieval.

5.2 UML / DFD

Use Case Diagram: The use case diagram represents the key interactions between users and the system. It includes functionalities such as:

- User Registration and Login
- AI Chat Interaction
- Taking Mental Health Assessments
- Viewing Results and Analytics
- Managing User Profile

These use cases highlight how users engage with the platform to access mental health support features.

Data Flow Diagram (DFD):

- User sends request → Frontend
- Frontend → Backend API
- Backend validates request → Database
- Database response → Backend → Frontend

5.3 UI / UX Design

The UI/UX design of Eyra focuses on providing a calm, intuitive, and user-centric experience, particularly important for mental health applications.

- **Clean and Minimal Interface:**
The platform uses a simple and uncluttered design to reduce cognitive load and create a comfortable environment for users.
- **Responsive Design:**
The application is fully responsive and optimized for various devices, including desktops, tablets, and mobile phones, ensuring accessibility anytime and anywhere.
- **Ease of Navigation:**
The interface is designed for smooth navigation with minimal steps required to access features such as chat, assessments, and analytics.

6. Implementation Details (Frameworks, APIs/Core logic /code snippets/Database design and schema)

6.1 Frameworks

The *Eyra: AI-Powered Mental Health Support Platform* is developed using the MERN stack, which includes MongoDB, Express.js, React.js, and Node.js. This stack was chosen due to its flexibility, scalability, and ability to support full-stack JavaScript development, enabling seamless integration between frontend and backend components.

- **Node.js:**

Node.js serves as the runtime environment for the backend. Its asynchronous, event-driven architecture allows efficient handling of multiple concurrent user requests, which is particularly important for real-time chat interactions and assessment processing. This ensures high performance and responsiveness even under heavy usage.

- **Express.js:**

Express.js is used as the backend framework to simplify server-side development. It provides structured routing, middleware support, and efficient request handling. RESTful APIs are developed using Express.js to manage functionalities such as user authentication, chat processing, assessment submissions, and analytics retrieval in a clean and maintainable way.

- **React.js:**

React.js is used for frontend development due to its component-based architecture and efficient rendering. The user interface is divided into reusable components such as chat interface, assessment forms, dashboards, and navigation elements. This modular design improves maintainability, enhances performance, and ensures a consistent user experience across devices.

- **MongoDB:**

MongoDB is used as the primary database due to its NoSQL, document-oriented structure,

which is well-suited for handling dynamic and unstructured data such as chat messages, assessment responses, and user activity logs. MongoDB Atlas is used for cloud-based database hosting, ensuring scalability, reliability, and secure data management.

6.2 APIs and Integration

- APIs are designed using standard HTTP methods (GET, POST, PUT, DELETE) to perform operations such as:
 - User registration and login
 - Chat message handling
 - Assessment submission and evaluation
 - Retrieval of analytics and reports
- **AI Integration:**
Google Generative AI is integrated into the backend to process user inputs and generate context-aware, empathetic responses. This forms the core of the conversational support system.
- **Email Integration:**
Email services are used to send assessment results and notifications to users, improving accessibility and user engagement.

6.3 Core Logic / Code Snippets

The core functionality of Eyra is implemented through a modular backend structure using controllers, services, and middleware.

- **AI Chat Processing:**
User input is sent to the backend, where it is processed and forwarded to the AI model. The generated response is then returned to the frontend and displayed in real time.
- **Assessment Evaluation:**
Assessment responses (e.g., PHQ-9, GAD-7) are processed using predefined scoring algorithms.

Based on the total score, severity levels are calculated and categorized (mild, moderate, severe, extreme).

- **Authentication Logic:**

User authentication is handled using JWT. Tokens are generated during login and verified through middleware to protect secure routes such as user dashboard, chat history, and assessment data.

- **Mood Tracking and Analytics:**

User interactions and assessment results are analysed to generate mood trends. This data is processed and visualized using charts and graphs on the frontend.

- **Session Management:**

Multiple chat sessions are supported, allowing users to organize conversations based on topics.

6.3.1 Frontend and backend hierarchy file

6.3.2 Server File

```
Release Notes: 1.118.1  JS server.js X
backend > JS server.js
1 // Import required packages
2 const express = require('express');
3 const dotenv = require('dotenv');
4 const cors = require('cors');
5
6 // Load environment variables from .env file AS EARLY AS POSSIBLE
7 // so any modules that read process.env during import see the values.
8 dotenv.config();
9
10 const connectDB = require('./config/db');
11 // Import routes AFTER dotenv is configured to avoid undefined envs in controllers
12 const userRoutes = require('./routes/userRoutes');
13 const chatRoutes = require('./routes/chatRoutes');
14
15 connectDB();
16 // Initialize the Express app
17 const app = express();
18
19 // Trust proxy for production environments
20 app.set('trust proxy', 1);
21
22 // Middlewares
23 // CORS configuration for production and development
24 const allowedOrigins = process.env.FRONTEND_ORIGIN
25   ? process.env.FRONTEND_ORIGIN.split(',').map(origin => origin.trim())
26   : ['http://localhost:5173'];
27
28 app.use(cors({
29   origin: (origin, callback) => {
30     // Allow requests with no origin (like mobile apps or curl requests)
31     if (!origin) return callback(null, true);
32
33     if (allowedOrigins.indexOf(origin) !== -1 || allowedOrigins.includes('*')) {
34       callback(null, true);
35     } else {
36       callback(new Error('Not allowed by CORS'));
37     }
38   },
39   credentials: true,
40   methods: ['GET', 'POST', 'PUT', 'DELETE', 'OPTIONS'],
41   allowedHeaders: ['Content-Type', 'Authorization']
42 })); // Enable Cross-Origin Resource Sharing
43
44 // Increase body size limit for image uploads (base64 encoded images can be large)
45 app.use(express.json({ limit: '50mb' })); // Allow the server to accept JSON data in request bodies
46 app.use(express.urlencoded({ limit: '50mb', extended: true })); // Allow URL-encoded data
47
48 // Health check endpoint for deployment platforms
49 app.get('/healthz', (req, res) => {
50   res.status(200).json({ status: 'ok', timestamp: new Date().toISOString() });
51 });
52
53 // A simple test route to check if the server is running
54 app.get('/', (req, res) => {
55   res.send('Hello! The Mental Health Companion API is running.');
56 });
57
58 app.use('/api/users', userRoutes);
59 app.use('/api/chat', chatRoutes);
60 // Define the port the server will run on
61 // Use the PORT from environment variables, or default to 5000
62 const PORT = process.env.PORT || 5000;
63
64 // Start the server
65 app.listen(PORT, () => {
66   console.log(`Server is running on port ${PORT}`);
67 });
```

6.4 Database Design and Schema

Eyra utilizes a custom-designed database implemented using MongoDB, a NoSQL database chosen for its flexibility, scalability, and ability to efficiently handle unstructured and semi-structured data. Given the dynamic nature of mental health data—such as chat conversations, assessment responses, and user interactions—MongoDB provides an ideal solution for managing diverse data formats while ensuring high performance.

6.4.1 Database Analysis

The database design focuses on optimizing the storage, retrieval, and management of key data entities within the platform. The system is structured into several core collections, each serving a specific purpose:

- **Users Collection:**
Stores user-related information such as name, email, encrypted password, and profile details. It also maintains authentication data and user preferences required for personalized experiences.
- **Chat Sessions Collection:**
Contains records of user interactions with the AI chatbot. Each session includes messages, timestamps, and contextual data, enabling continuity in conversations and future analysis of user behaviour.
- **Assessments Collection:**
Stores responses from various mental health assessments such as PHQ-9 and GAD-7. This includes question-wise answers, calculated scores, severity levels, and timestamps for tracking progress over time.
- **Analytics / Mood Tracking Collection:**
Maintains processed data used for generating insights and visualizations. It includes mood trends, sentiment analysis results, and historical patterns derived from user interactions and assessments.
- **Notifications / Reports Collection (Optional Extension):**
Stores generated reports, alerts, and email communication logs related to assessment results or important mental health indicators.

6.4.2 Database Design

6.4.3 Database Implementation

- **Mongoose:** an ODM for MongoDB, was used for defining schemas and performing CRUD operations:
- **Connection:** The database connects to MongoDB via Mongoose, using MongoDB Atlas.
- **Models:** Mongoose models define schema for each collection, enforcing validation
- **CRUD Operations:** Implemented for creating new products, updating stock, and managing user orders.

Face Insights –

7. Testing and Validation

- **Manual Testing:** Core features were manually tested during development by executing APIs and checking outputs through the frontend.
- **API Testing:** Backend APIs were tested using different inputs to verify correct responses and error handling.
- **Functional Testing:**

All major functionalities of the platform were tested to confirm that they met the specified requirements. This included:

 - User registration and login
 - AI chat interaction
 - Mental health assessment flow
 - Result generation and visualization
 - Dashboard and analytics display

8. Major Findings / Outcomes / Results

- **Improved Accessibility to Mental Health Support:** Eyra provides users with immediate access to mental health assistance through AI-driven chat and self-assessment tools, reducing dependency on traditional, time-bound support systems.
- **Personalized User Experience:** The platform delivers context-aware and adaptive responses based on user inputs, enabling a more personalized and empathetic interaction that enhances user engagement and trust.
- **Effective Self-Assessment Mechanism:** Integration of clinically validated tools such as PHQ-9 and GAD-7 allows users to evaluate their mental health accurately, promoting self-awareness and early identification of potential issues.
- **Insightful Mood Tracking and Analytics:** The system generates visual insights through charts and trends, helping users track emotional patterns over time and better understand their mental health progression.
- **Technological Efficiency and Scalability:** The use of the MERN stack (MongoDB, Express.js, React.js, Node.js) ensures a scalable, responsive, and efficient system capable of handling real-time interactions and future expansions.

9. Conclusion and Future Scope

9.1 Conclusion

Eyra: AI-Powered Mental Health Support Platform represents a significant step toward making mental health support more accessible, personalized, and stigma-free. By integrating advanced artificial intelligence with clinically grounded assessment tools, the platform provides users with a safe and supportive environment to explore and understand their emotional well-being.

Eyra successfully combines key features such as AI-driven conversational support, evidence-based mental health assessments, and intuitive analytics to deliver meaningful insights into users' mental states. By reducing barriers such as cost, stigma, and lack of awareness, Eyra empowers individuals to take the first step toward better mental health.

In conclusion, Eyra demonstrates how technology can be leveraged responsibly to address real-world challenges. By promoting awareness, accessibility, and informed decision-making, the platform contributes to building a more supportive and mentally healthy society.

9.2 Future Scope:

- **Integration with Mental Health Professionals:** The platform can be extended to include secure connections with licensed therapists and counsellors. This would enable users to transition seamlessly from AI-based support to professional consultation when needed, creating a hybrid mental healthcare ecosystem.
- **Mobile Application Development:** Developing native mobile applications for Android and iOS would significantly increase accessibility. A mobile-first approach would allow users to access support anytime and anywhere, improving engagement and usability.
- **Multilingual Support:**
Expanding language support will make Eyra accessible to a broader and more diverse audience. This would help break language barriers and promote mental health awareness globally.
